# Optimization Calculations

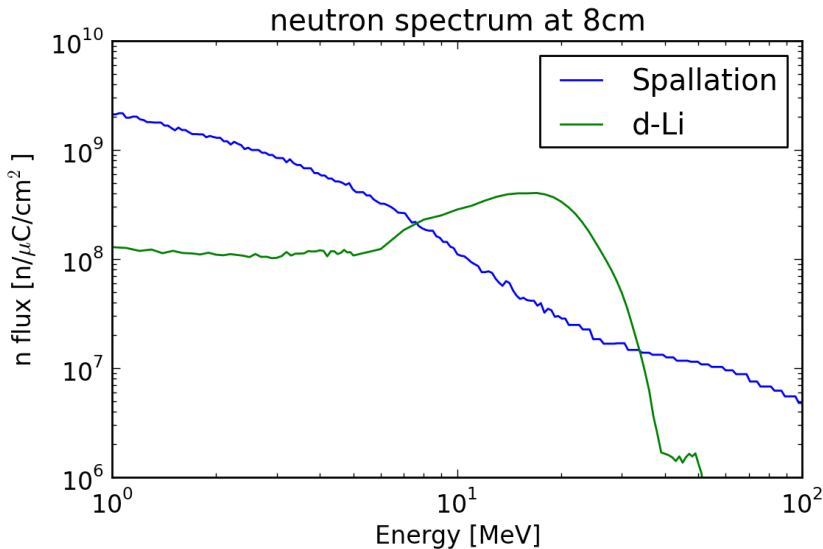

Primary Target

Made from  
C / Li / Be ...

Secondary Target

${}^9\text{Be}(n, 2n){}^8\text{Be}$   
 ${}^9\text{Be}(n, \alpha){}^6\text{He}$

Reflector

Material	Reaction	half life [msec]	Yield $\left[ \frac{10^{12} \text{ atoms}}{\text{mA sec}} \right]$
$\text{BeO}$	${}^9\text{Be}(n, \alpha){}^6\text{He}$	807	2.53
	${}^9\text{Be}(n, p){}^9\text{Li}$	178	0.033
	${}^{16}\text{O}(n, p){}^{16}\text{N}$	7130	0.9
$\text{B}_4\text{C}$	${}^{11}\text{B}(n, \alpha){}^8\text{Li}$	838	0.87
	${}^{11}\text{B}(n, p){}^{11}\text{Be}$	13810	0.14
	${}^{12}\text{C}(n, p){}^{12}\text{B}$	20	0.24
	${}^{13}\text{C}(n, p){}^{13}\text{B}$	17	$6.63 \cdot 10^{-4}$

Hass et al., J. Phys. G: Nucl. Part. Phys., 35, 014042 (2008)

The above yields are for porous targets,  $R=4$  cm,  $D=8$  cm,  $L=1$  cm

# High temperature furnace

- Especially designed to maintain large ISOL targets in a uniform temperature of up to 1500°C
- Only a thin layer of molybdenum heat shield separates the primary and secondary targets
- Direct mount on top of LiFTiT

# The B<sub>4</sub>C target

- High porosity (65%)
- 1-5 micrometer grains
- Melting point 2300 °C
- High boron content

# Summary

The two-stage irradiation scheme is expected to provide orders of magnitude more  $^8\text{Li}$  (and  $^6\text{He}$ ) RIB

These intense beams may allow the trapping of an intense light RIB for various experiments

A first full production and extraction experiment is planned to take place in the frame of SARAF phase I

Towards a specific design of a target for SPIRAL2 and/or SARAF

# Outline/TODO

- ☑ Calculate the production numbers
- ☑ Optimize the irradiation scheme design
- ☑ Measure the extraction efficiency
- ☑ Test the full system integration
- ☑ Summarize
